Market data as of 2026-03-29 16:36 UTC
Oct 29, 2026, 3:36 PM New York · refreshed daily

CRYPTO FORECASTING RESEARCH · BTC · ETH · XRP · LINK

Will Bitcoin, Ether, XRP and Chainlink move up, down or sideways over the next 30 days? Below: what our tested models expect for each coin, which model has the best record, and what live Deribit option prices imply for each listed expiry. The research behind it asks whether price history or machine learning can beat a simple base rate.

30-day outlook: what the models expect

For each coin: the call (▲ FLAT, ▼ FLAT), the chances of a move of more than 10% over the next 30 days, and the model with the best record on the final test. Recomputed daily from forecast files, as of Oct 29, 2026.

Direction: not predictable - no reliable edge found

Testing many models, built to read trend and momentum were reliably worse than the base rate in 10 of 22 tests and reliably better in 0. For 3 of 4 coins, long-run history and the past year's trend point in opposite directions. So any UP or DOWN call below is a lean, not a forecast with a proven edge.

Size of moves: partly predictable - the models' real edge

Volatility models, which forecast how big moves are likely to be rather than which way, had positive skill against the base rate in 17 of 22 development tests (up to +14.2%). On the one-time final test, none passed every condition: the best, for BTC, was within noise. The ranges below are the most useful part of each outlook.

BTC

$81,249 · close of Oct 28, 2026

▶ FLAT

No directional edge. Most likely within ±10% (BTC $73,124 – $89,374). 64% chance.

▲ over +10% 48% | within ±10% 36% | ▼ up +10% 16%

Lean: up 37% chance of rising more than 10% vs. 30% for the opposite move. Big moves are likely either way (67% chance of more than ±10%).

▲ down +10% 30% | within ±10% 33% | ▼ up +10% 37%

80% range in 30 days: **$70,265 – $92,647**

80% range in 30 days: **$1,751 – $1,544**

Headline model: **Logreg/mac 75-day vol**. Best on the final test: +23.2% skill vs the base rate. Hit rate: 64% (base 65%) · −7.9% to +8.4%). 8 forecasts for the size of moves, not their direction.

Headline model: **Base rate (past frequency)**. No model beat it on the final test; the closest was Logreg/vol, 90-day vol (-1.8%).

LINK

$11.82 · close of Oct 28, 2026

▶ FLAT

No directional edge, but big swings are likely 66% chance of moving more than 10% either way.

▲ over +10% 34% | within ±10% 32% | ▼ up +10% 34%

80% range in 30 days: **$8.58 – $15.42**

Headline model: **GARCH(1,1)** Best on the final test: -0.1% still in the base rate, within noise (95% : -5.6% to +1.7%). 8 forecasts for the size of moves, not their direction.

Direction signals
Long-run history ▶ flat +4 pts
Past-year trend ▼ down −12 pts

Options market no listed options

How the call is made. Headline model: the best skill on the sealed final test (spot prices, 30 days) for that asset, or the base rate if no model beat it. UP or DOWN only when the headline model's direction call is reliable; otherwise ▶ FLAT. Chances of a move up or down of more than 10%: the model's own estimate (Normal GJR-GH-1 with volatility models have no view on direction, so they always give 50%). **Hit rate** = how often the direction call was correct. Dates and ranges are based on Nov 13, 2026. These are research outputs, not investment advice.

Reading the options market

Market-implied, not a forecast
Probabilities come from option prices, which include a risk premium investors pay to be protected. Read them as the market's pricing, not a prediction or advice.

Ranges show quote uncertainty
Options trade with a bid and an ask. The quote range is every probability consistent with those prices - the wider it is, the less liquid.

"Not quoted" is not 0%
Far from today's price no options are quoted, so the market implies nothing there. Those ranges are marked rather than guessed.

Market snapshot

Every listed expiry at a glance. The median and the 80% range are read off the market-implied curve: 10% of the probability sits below the range and 10% above it.

LINK

No market-implied odds: No listed LINK options on Deribit, OKX, Gate, Derive, Delta, Aevo, Thalex or Coinbase Derivatives (verified Nov 2026-10-11); CME lists LINK futures only. Perpetuals and ETF (Grayscale, iShares) options are not substitutes (brief 5.3). See research/STAGES_COVERAGE.md#d.

Can history or machine learning beat the base rate?

Each model faces the same test: a forecast for the options above, using only data available at the time, and was scored against what actually happened. The yardstick is the **base rate**: the share of days a move that size happened before.

Mostly no. Across 22 asset × horizon tests, the best price-history model was reliably better than the base rate in only 3, inactive learning in 0, and the Chronos foundation model in 5 of the 16 it covered. On the sealed final test (the most recent 20% of history, scored once), **no model was promoted**. Only 4 tests had enough outcomes to judge, so this is "no demonstrated improvement," not proof of no edge.

			+4.9%	**-12.5%** Volatility better	**+5.5%**
XRP	90 days	27	Logreg/vol, EWMA vol	…†	Random forest	…†
			+5.7%	**-15.1%** Volatility better	**+6.1%**

Skill: reduction in forecast error versus the base rate (how often a move that size happened before). 0% = no better, +10% = 10% less error, negative = worse.

Separate outcomes: non-overlapping windows. Daily forecasts overlap, so this count, not a few dozen, decides how much a result can be trusted.

Volatility better / **worse**: the 95% interval excludes zero. A result without a tag is within noise.

—: The OVLS implied-vol index exists for BTC and ETH only. **†** Chronos forecasts 30 and 60 days only. **…**: Not enough price history to train.

Method. Results above are from the development period (Brier skill vs past event frequency (climatology); 95% block-bootstrap interval; development period only). Every forecast used only data available on its date. **Final test**: the last 20% of history (settlements since 2025-09-30, spot from 2025-04-02) was set aside before any model was built and scored once under a promotion rule fixed in advance. Testable there: spot-ETC 30d, spot-ETH 30d, spot-LINK 30d, spot-XRP 30d. ML models (logistic regression, random forest, XGBoost) were trained walk-forward with past-only tuning and shrink-only calibration. Neural nets and the base rate on the best history model in any test. Chronos (bolt, a pretrained time-series foundation model (Amazon, weights frozen Nov 2024), 30- and 60-day moves from price history alone, it did not beat the best history model in any test. All tests: 2,000 resamples, 95% CI (2.5th–97.5th settlement, 60 days, via its volatility forecast), where the best history model also did. Full results, conditions for prediction, and on the Model Scorecard.
