OPTIONS-MARKET RESEARCH · BTC · ETH · XRP

Where do option traders think Bitcoin, Ether and XRP will settle on each listed expiry date? This page reads the answer out of live Deribit option prices, then asks a second question: can price history or machine learning predict these moves better than a simple base rate?

Market-implied, not a forecast
Probabilities come from option prices, which include a risk premium (traders pay up for protection). Read them as the market's pricing, not a prediction or advice.

Ranges show quote uncertainty
Options trade with a bid and an ask. The quote range is every probability consistent with those prices: wide when the market is thin, tight when it is liquid.

"Not quoted" is not 0%
Far from today's price no options are quoted, so the market says nothing there. Those targets are marked rather than guessed.

Market snapshot

Every listed expiry at a glance. The median and the 80% range are read off the market-implied curve: 10% of the probability sits below the range and 10% above it.

ASSET	EXPIRY	PRICE TODAY	MARKET MEDIAN	80% MARKET RANGE	CHANCE ABOVE TODAY	IMPLIED VOL
BTC	Nov 27, 2026 · 44 days	$81,580	**$82,047**	$69,567 – $95,284	**52%**	37%
	Dec 25, 2026 · 72 days		**$82,069**	$66,173 – $99,573	**52%**	38%
ETH	Nov 27, 2026 · 44 days	$2,424	**$2,420**	$1,924 – $2,952	**50%**	50%

LINK

No market-implied odds: No listed LINK options on Deribit, OKX, Gate, Derive, Delta, Aevo, Thalex or Coinbase Derivatives (verified live 2026-10-11); CME lists LINK futures only. Perpetuals and ETF (GLNK) options are not substitutes (brief s.3). See research/STAGE1_COVERAGE.md.

Can history or machine learning beat the base rate?

Each model forecast the same kind of price targets as the options above, using only data available at the time, and was scored against what actually happened. The yardstick is the **base rate**: how often a move that size happened before.

Mostly no. Across 22 asset × horizon tests, the best price-history model was reliably better than the base rate in only **1**, machine learning in **0**, and the Chronos foundation model in **1** of the 16 it covered. On the sealed final test (the most recent 20% of history, scored once), **no model was promoted**. Only 4 tests had enough outcomes to judge, so this is "no demonstrated improvement", not proof of no skill.

Settlement prices (Deribit, 08:00 UTC)

ASSET	HORIZON	SEPARATE OUTCOMES	BEST HISTORY MODEL	IMPLIED VOL (DVOL)	BEST MACHINE LEARNING	FOUNDATION MODEL
BTC	30 days	53	Lognormal, 90-day vol **+7.0%**	**+6.4%**	Logistic regression **−10.0%**	Chronos (volatility) **+6.4%**
BTC	60 days	25	GARCH(1,1)-t **+3.6%**	**+4.0%**	Logistic regression **−2.8%**	Chronos (price) **+7.2%**
BTC	90 days	16	GARCH(1,1)-t **+7.8%**	**+4.1%**	Random forest **−5.2%**	—[b]
ETH	30 days	52	Lognormal, 90-day vol **+10.3%**	**+9.8%**	Logistic regression **−8.0%**	Chronos (volatility) **+10.3%**
ETH	60 days	25	Lognormal, 90-day vol **+10.9%**	**+10.8%**	Random forest **−9.2%**	Chronos (volatility) **+9.9%**
ETH	90 days	16	Lognormal, 90-day vol **+14.2%**	**+14.6%**	Random forest **−6.1%**	—[b]
LINK	30 days	26	Lognormal, 90-day vol **+0.5%**	—[a]	Random forest **−15.2%** reliably worse	Chronos (volatility) **+0.6%**
LINK	60 days	12	Lognormal, 90-day vol **+6.1%** reliably better	—[a]	Random forest **−58.3%** reliably worse	Chronos (volatility) **+6.2%** reliably better
XRP	30 days	27	Filtered hist. simulation **−1.7%**	—[a]	Random forest **−9.2%**	Chronos (volatility) **−1.1%**
XRP	60 days	12	Filtered hist. simulation **−5.1%** reliably worse	—[a]	Random forest **+0.1%**	Chronos (volatility) **−4.0%**

Not scored: LINK 90 days, XRP 90 days. This price history is too short for that horizon.

Spot closes (Coinbase / Bitstamp)

XRP	30 days	86	Lognormal, 90-day vol **+3.8%**	—[a]	Random forest **−4.7%**	Chronos (volatility) **+3.8%**
XRP	60 days	42	Lognormal, EWMA vol **+4.9%**	—[a]	Random forest **−12.5%** reliably worse	Chronos (volatility) **+5.5%**
XRP	90 days	27	Lognormal, EWMA vol **+5.7%**	—[a]	Random forest **−21.5%** reliably worse	—[b]

Skill: reduction in forecast error versus the base rate (how often a move that size happened before). 0% = no better, +10% = 10% less error, negative = worse.

Separate outcomes: non-overlapping windows. Daily forecasts overlap, so this count, usually a few dozen, decides how much a result can be trusted.

Reliably better / worse: the 95% interval excludes zero. A result without a tag is within noise.

— [a] the DVOL implied-vol index exists for BTC and ETH only. [b] Chronos forecasts 30 and 60 days only. [c] too little history to train.

Method. Results above are from the development period (Brier skill vs past event frequency (climatology); 95% block-bootstrap interval; development period only). Every forecast used only data available on its date. **Final test:** the last 20% of history (settlement outcomes from 2025-08-30, spot from 2025-04-02) was set aside before any model was built and scored once under a promotion rule fixed in advance. Testable there: spot BTC 30d, spot ETH 30d, spot LINK 30d, spot XRP 30d. ML models (logistic regression, random forest, XGBoost) were trained walk-forward with past-only tuning and shrink-only calibration. None beat the base rate or the best history model in any test. Chronos-Bolt, a pretrained time-series foundation model (Amazon, weights frozen Nov 2024), forecast 30- and 60-day moves from price history alone; it did not beat the best history model in any test, and beat the base rate with confidence in only 1 of 16 (LINK settlement, 60 days, via its volatility forecast), where the best history model also did. Full results, condition by condition, are on the Model Scorecard.
