Market data as of 2026-10-24 16:58 UTC
Oct 24, 2026, 12:58 PM New York · refreshed daily

CRYPTO FORECASTING RESEARCH · BTC · ETH · XRP · LINK

Will Bitcoin, Ether, XRP and Chainlink move up, down or sideways over the next 30 days? Below: what our tested models expect for each coin, which model has the best record, and what live Deribit option prices imply for each asset's volatility. The research behind it asks whether price history or machine learning can beat a simple base rate.

30-day outlook: what the models expect

For each coin: the call (UP, DOWN or FLAT), the chances of a move of more than 10% over the next 30 days, and the model with the best record on the final test. Reconstructed daily from fresh prices, as of Oct 24, 2026.

Direction: not predictable · no reliable edge found

Machine-learning models built to read trend and momentum were **reliably worse** than the base rate in 10 of 12 tests and within hundredths in 2. For 3 of 4 coins, long-run history and the past year's trend point in opposite directions. So any UP or DOWN call below is a lean, not a forecast with a proven edge.

Size of moves: partly predictable · the models' real edge

Volatility models, which forecast how far prices swing rather than which way, had positive skill against the base rate in 17 of 20 evaluations (tests up to +14.2%). On the one-time final test, none passed every condition: the best, for BTC, was within noise. The ranges below are the most useful part of each outlook.

BTC ▶ FLAT

$81,078 · close of Oct 23, 2026

Lean: flat · 18% bullish tilt

Signs within ±10%: BTC 972, ETH 1,000, XRP 1,000, LINK 1,000 (of $970,350–$89,186): 64% chance.

▼ down >10% within ±10% ▲ up >10%
18% 64% 18%

80% range in 30 days: **$69,991 – $92,791**

Headline model: **Logmormal, 90-day vol**. Best on the final test: +16.2% skill vs the base rate, within noise (95% −7.9% to +44.3%). It forecasts the size of moves, not their direction.

Direction signals
Long-run history ▲ up +14 pts
Past-year trend ▼ down -10 pts
Options market (Nov 27, 2026, 34d): **▼ 16% · ▲ 16%**

ETH ▲ UP

$2,364 · close of Oct 23, 2026

Leans up · 37% chance of rising more than 10%, up to 30% over the whole move. Big moves are likely either way (67% chance of more than ±10%).

▼ down >10% within ±10% ▲ up >10%
30% 33% 37%

80% range in 30 days: **$1,791 – $3,586**

Headline model: **Base rate (past frequency)**. No model beat it on the final test; the closest was Logmormal, 90-day vol (−1.8%).

Long-run history ▲ up +7 pts
Past-year trend ▼ down -16 pts
Options market (Nov 27, 2026, 34d): **▼ 24% · ▲ 25%**

XRP ▶ FLAT

$1.29 · close of Oct 23, 2026

No directional edge, but big swings are likely · 62% chance of moving more than 10% either way.

▼ down >10% within ±10% ▲ up >10%
33% 38% 29%

80% range in 30 days: **$0.96 – $1.92**

Headline model: **Base rate (past frequency)**. No model beat it on the final test; the closest was Logmormal, 90-day vol (−4.5%).

Direction signals
Long-run history ▶ flat −3 pts
Past-year trend ▼ down -19 pts
Options market (Nov 27, 2026, 34d): **▼ 26% · ▲ 24%**

LINK ▶ FLAT

$11.81 · close of Oct 23, 2026

No directional edge, but big swings are likely · 67% chance of moving more than 10% either way.

▼ down >10% within ±10% ▲ up >10%
37% 33% 30%

80% range in 30 days: **$8.49 – $15.55**

Headline model: **GARCH(1,1)-t**. Best on the final test: +3.1% skill vs the base rate, within noise (95% −5.8% to +13.7%). It forecasts the size of moves, not their direction.

Direction signals
Long-run history ▶ flat +4 pts
Past-year trend ▼ down -10 pts
Options market · no listed options

How the call is made. Headline model: the best skill on the seated final test (past prices, 30 days) for that asset, or the base rate if no model beat it. UP or DOWN only when the headline model estimates direction and its chances of a move up or down of more than 10% differ by 5 points or more; otherwise FLAT. Zero-drift volatility models have no view on direction, so they always give FLAT. **Track record:** 40 calls logged since Oct 14, 2026; the first are graded on Nov 13, 2026. These are research outputs, not investment advice.

Reading the options market

Market-implied, not a forecast

Probabilities come from option prices, which include a risk premium (traders pay up for protection). Read them as the market's pricing, not a prediction or advice.

Ranges show quote uncertainty

Options trade with a bid and an ask. The quote range is exactly probability consistent with those prices: wide when the market is thin, tight when it is liquid.

"Not quoted" is not 0%

Far from today's price no options are quoted, so the market says nothing there. Those targets are marked rather than guessed.

Market snapshot

Every listed expiry at a glance. The median and the 80% range are read off the market-implied curve: 10% of the probability sits below the range and 10% above it.

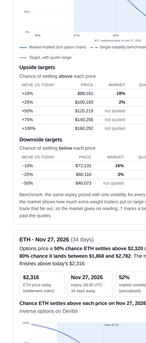

ASSET	EXPIRY	PRICE TODAY	MARKET MEDIAN	80% MARKET RANGE	CHANCE ABOVE TODAY	IMPLIED VOL

LINK

No market-implied odds: No listed LINK options on Deribit, OKX, Gate, Derive, Delta, Aevo, Thalex or Coinbase Derivatives (verified live 2026-10-11); CME lists LINK futures only. Perpetuals and ETF (GLNK) options are not substitutes (brief s.3). See research/STAGE1_COVERAGE.md.

Can history or machine learning beat the base rate?

Each model forecast the same kind of price targets as the options above, using only data available at the time, and was scored against what actually happened. The yardstick is the **base rate**: how often a move that size happened before.

Mostly no. Across 22 asset × horizon tests, the best price-history model was reliably better than the base rate in only 1, machine learning in 8, and the Chronos foundation model in 3 of the 16 it covered. On the seated final test (the most recent 20% of history, scored once), **no model was promoted**. Only 4 tests had enough outcomes to judge, so this is "no demonstrated improvement", not proof of no skill.

Settlement prices (Deribit, 08:00 UTC)

ASSET	HORIZON	SEPARATE OUTCOMES	BEST HISTORY MODEL	IMPLIED VOL (DVOL)	BEST MACHINE LEARNING	FOUNDATION MODEL

Skill: reduction in forecast error versus the base rate (how often a move that size happened before). 0% = no better, +10% = 10% less error, negative = worse.

Separate outcomes: non-overlapping windows. Daily forecasts overlap, so this count, usually a few dozen, decides how much a result can be trusted.

Reliably better / worse: the 95% interval excludes zero. A result without a tag is within noise.

* = the DVOL implied-vol index exists for BTC and ETH only. † Chronos forecasts 30 and 60 days only. ‡ too little history to train.

Method. Results above are from the development period (Brier skill vs past event frequency (climatology); 95% block-bootstrap interval; development period only). Every forecast used only data available on its date. **Final test:** the last 20% of history (settlement outcomes from 2025-08-30, spot from 2025-04-02) was set aside and ignored until one model was chosen under a promotion rule fixed in advance. Testable there: spot BTC 300, spot ETH 300, spot LINK 300, spot XRP 300. ML models (logistic regression, random forest, XGBoost) were trained walk-forward with past-only tuning and shrink-only calibration. None beat the base rate or the best history model in any test. Chronos-Bolt, a pretrained time-series foundation model (Amazon, frozen Nov 2024), ran 3- and 60-day moves from price history alone; it did not beat the best history model in any test, and beat the base rate with confidence in only 1 of 16 (LINK settlement, 60 days, via its volatility forecast), where the best history model also did. Full results, condition by condition, are on the Model Scorecard.
