Crypto Price Odds

Market data as of 2026-10-29 18:11 UTC
Oct 29, 2026, 12:11 PM New York · refreshed daily

CRYPTO FORECASTING RESEARCH · BTC · ETH · XRP · LINK

Will Bitcoin, Ether, XRP and Chainlink move up, down or sideways over the next 30 days? Below: what our tested models expect for each coin, which model has the best record, and what live Deribit option prices imply for each tested expiry. The research behind it asks whether price history or machine learning can beat a simple base rate.

30-day outlook: what the models expect

For each coin: the call (▲ FLAT, ▼ FLAT), the chances of a move of more than 10% over the next 30 days, and the model with the best record on the final test. Recomputed daily from forecasts, as of Oct 29, 2026.

Direction: not predictable - no reliable edge found

Machine learning models built to beat trend and momentum were reliably worse than the base rate in 10 of 22 tests and reliably better in 0. For 3 of 4 coins, long-run history and the past year's trend point in opposite directions. So any UP or DOWN call below is a lean, not a forecast with a proven edge.

Size of moves: partly predictable - the models' real edge

Volatility models, which forecast how big moves are rather than which way, had positive skill against the base rate in 17 of 22 development tests (up to +14.2%). On the one-time final test, none passed every condition: the best, for BTC, was within noise. The ranges below are the most useful part of each outlook.

BTC

$81,249 · close of Oct 28, 2026

▶ FLAT

No directional edge. Most likely within +10% (▲ $71,124) to −10% ($89,374). 64% chance.

▲ down −10% within 30% · ▲ up +10% within 30%

80% range in 30 days	$70,265 – $92,667
80% range in 90 days	$61,751 – $103,544

Headline model: **Logreg/mac 30-day vol**. Best on the final test: +10.2% skill vs the base rate, with a 95% chance (95% −7.9% to +44.3%). Result is the sum of moves, not their direction.

Direction signals

Long-run history	▲ up +14 pts
Past-year trend	▼ down −10 pts
Options market (Nov 27, 2026, 29d)	▼ 13% – 15% – 15%

XRP

$1.32 · close of Oct 28, 2026

▶ FLAT

No directional edge, but big swings are likely 62% chance of moving more than 10% either way.

▲ down −10% within 30% · ▲ up +10% within 30%

80% range in 30 days	$0.98 – $1.97
80% range in 90 days	$0.74 – $2.65

Headline model: **Base rate (past frequency)**. No model beat it on the final test, the closest was Logreg/mac 90-day vol (−1.6%).

Direction signals

Long-run history	▶ flat −3 pts
Past-year trend	▼ down −23 pts
Options market (Nov 27, 2026, 29d)	▼ 23% ▲ 22% 22%

LINK

$11.82 · close of Oct 28, 2026

▶ FLAT

No directional edge, but big swings are likely 66% chance of moving more than 10% either way.

▲ down −10% within 30% · ▲ up +10% within 30%

80% range in 30 days	$8.58 – $15.42
80% range in 90 days	$6.46 – $21.61

Headline model: **GARCH(1,1)** (best on the final test, −2.1% skill vs the base rate, within noise (95% −5.6% to +1.7%). It forecasts the size of moves, not their direction.

Direction signals

Long-run history	▶ flat +4 pts
Past-year trend	▼ down −12 pts
Options market	no listed options

How the call is made. Headline model: the best skill on the seated final test (spot prices, 30 days) for that asset, or the base rate if no model beat it. UP or DOWN only when the headline model clears the chosen threshold (at least 2% chances of a move up or more down of more than 10% over the next 30 days); otherwise FLAT. Direction skill: volatility models have no view on direction, so they always give FLAT. **Track record:** 60 calls logged since Oct 14, 2026; the first are graded on Nov 13, 2026. These are research outputs, not investment advice.

Reading the options market

Market-implied, not a forecast

Probabilities come from option prices, which include a risk premium investors pay to be protected. Read them as the market's pricing, not a prediction or advice.

Ranges show quote uncertainty

Options trade with a bid and an ask. The quote range is every probability consistent with those prices: the wider it is, the less liquid the option is.

"Not quoted" is not 0%

Far from today's price no options are quoted, so the market implies nothing there. Those ranges are marked rather than guessed.

Market snapshot

Every listed expiry at a glance. The median and the 80% range are read off the market-implied curve: 10% of the probability sits below the range and 10% above it.

ASSET	EXPIRY	PRICE TODAY	MARKET MEDIAN	80% MARKET RANGE	CHANCE ABOVE TODAY	IMPLIED VOL
BTC	Nov 27, 2026 · 29 days	$81,751	$82,284	$72,127 – $92,080	53%	35%

LINK

No market-implied odds: No listed LINK options on Deribit, OKX, Gate, Deribit_Delta, Aevo, Thalex or Coinbase Derivatives (verified Nov 2026-10-11). CME lists LINK futures only. Perpetuals and ETF (GLNK) options are not substitutes (brief 5.a). See research/STAGES_COVERAGE.md.

Can history or machine learning beat the base rate?

Each model forecast the same kind of price question as the options above, using only data available at the time, and was scored against what actually happened. The yardstick is the **base rate**: the share of days a move that size happened before.

Mostly no. Across 22 asset × horizon tests, the best price-history model was reliably better than the base rate in only 3, inactive learning in 0, and the Chronos foundation model in 5 of the 16 it covered. On the sealed final test (the most recent 20% of history, scored once), **no model was promoted**. Only 4 tests had enough outcomes to judge, so this is "no demonstrated improvement," not proof of no edge.

Skill: reduction in forecast error versus the base rate (how often a move that size happened before). 0% = no better, +10% = 10% less error, negative = worse.

Separate outcomes: non-overlapping windows. Daily forecasts overlap, so this count, not the raw forecast, decides how much a result can be trusted.

Volatility before/ after: the 95% interval excludes zero. A result without a tag is within noise.

Reliably better/ worse: the 95% interval excludes zero. A result without a tag is within noise.

—* The DVOL-implied-vol index exists for BTC and ETH only. † Chronos forecasts 30 and 60 days only. ‡ Too little history to train.

Method. Results above are from the development period (Brier skill vs past event frequency (climatology); 95% block-bootstrap interval; development period only). Every forecast used only data available on that date. **Final test:** the last 20% of history (settlements since 2025-08-30), split from 2025-04-02) was set aside before any model was built and scored once under a promotion rule fixed in advance. Testable there: spot-BTC 30d, spot-ETH 30d, spot-LINK 30d, spot XRP 30d. ML models (logistic regression, random forest, XGBoost) were trained walk-forward with past-only tuning and shrink-only calibration. Below the final test case or the best history model in any test. Chronos (bolt, a pretrained time-series foundation model (Amazon, weights frozen Nov 2024), 30- and 60-day moves from price history alone, it did not beat the best history model in any test. Implied vol: the DVOL-implied-vol index (BTC and ETH, 24/7 settlement, 60 days, via its volatility forecast), where the best history model did not. Full results, conditions for conditions, and on the Model Scorecard.
